GIT HUB

Please tell me who you are

Run

```
git config --global user.email "you@example.com"  
git config --global user.name "Your Name"
```

Push a folder to GitHub for the FIRST TIME (NEW PROJECT)

If your project wasn't cloned but created locally:

```
git init  
git add .  
git commit -m "Initial commit"  
git branch -M main  
git remote add origin https://github.com/YOUR\_USER/YOUR\_REPO.git  
git push -u origin main
```

Upload ONLY one folder (not everything)

If you don't want to push all files:

```
git add myfolder/  
git commit -m "Add only my folder"  
git push
```

Clone → Add Folder → Commit → Push

```
git clone https://github.com/USER/REPO.git  
cd REPO  
git add .  
git commit -m "Add new folder"  
git push
```

Fix common issues

Wrong branch pushed?

```
git branch  
git push origin BRANCH_NAME
```

Empty folder not added?

```
touch myfolder/.gitkeep  
git add .
```

Accidentally committed?

```
git reset --soft HEAD~1
```

Delete a folder and push

```
git rm -r foldername  
git commit -m "Remove folder"  
git push
```

Undo last commit (without deleting changes)

```
git reset --soft HEAD~1
```

Undo last commit (with deleting changes)

```
git reset --hard HEAD~1
```

Update your local repo

```
git pull
```

Stage only ONE folder

```
git add foldername/  
git commit -m "Add only this folder"  
git push
```

Create a new branch → Commit → Push

```
git checkout -b my-branch  
git add .  
git commit -m "Add folder"  
git push -u origin my-branch  
git push --set-upstream origin change1
```

These Git commands initialize a local repo and push it to GitHub

```
git init
git add .
git commit -m "Initial commit"
git remote add origin https://github.com/USERNAME/REPO_NAME.git
git branch -M main
git push -u origin main
```

But these commands DO NOT create the GitHub repository themselves. They only connect your local folder to a GitHub repo that must already exist.

□ Meaning of each command

1. git init

Creates a new local repository on your computer.

2. git add .

Stages all files.

3. git commit -m "Initial commit"

Creates your first commit.

4. git remote add origin <URL>

Links your local repository to a GitHub repo.

5. git branch -M main

Sets your branch name to main.

6. git push -u origin main

Pushes your local files to GitHub.
